

BUILD PLAN

Phase 1 Frontend / Phase 2 Backend / Phase 3 Admin Panel

Analyst: Claude | Builder: Antigravity | Director: Abdullah Rashid
Theme locked: Gallery Noir

1. How we work

Three roles, one rule: **nothing moves to the next milestone until it passes review.**

Role	Who	Does
Director	Abdullah	Makes the final calls, talks to the client, supplies content, approves each milestone.
Analyst / QA gatekeeper	Claude	Writes tightly scoped prompts, reviews every output against this plan, catches errors and scope creep.
Builder	Antigravity	Implements one milestone at a time, exactly as scoped, and reports back with evidence.

MILESTONE LOOP

- Claude writes the prompt for the next milestone. Abdullah sends it to Antigravity.
- Antigravity builds only that milestone, then returns: a short summary, desktop and mobile screenshots, a list of any new dependencies, and anything it was unsure about.
- Abdullah brings that back to Claude. Claude reviews it against the "done when" column and lists fixes.
- Fixes are made. Only when Claude signs off does the next milestone start.

RULES FOR THE BUILDER (apply to every prompt)

- Build **only** the current milestone. No extra features, pages or "improvements".
- Do not change the design tokens, fonts or colour values below without asking.
- No new dependency without naming it and saying why.
- If something is ambiguous, ask instead of guessing.
- Commit at the end of each milestone with a clear message.

2. Locked decisions

Item	Decision
Theme	Gallery Noir : warm black throughout, gold as a sparing accent, cream text. It follows the client's own logo.
Colours (sampled from the logo)	Background #151410 , surface #1E1C17 , line #4B3D2C , cream text #F2DEBF , champagne #E4C48F , gold #D0A971 , taupe #B4A187 , bronze #876D4F (borders and lines only, too dim for small text).
Type	Headings: elegant light serif, wide-tracked capitals for the wordmark. Primary candidate Cormorant Garamond (closest to the logo); Playfair Display as the comparison. Body: Inter . Script (tagline and small flourishes only): Allura or a thinner equivalent.
Hard rules	No carousel or slider anywhere . No static hero image. Hero is fully animated. Gold is an accent, never a flood. Paintings are the heroes, the interface recedes.
Site language and currency	English. Prices in PKR.

3. Proposed stack (to confirm before Phase 1 starts)

Layer	Proposal	Why
Frontend	React + Vite, React Router, plain CSS or CSS Modules with design tokens	Familiar, fast, no framework overhead. Tailwind is optional if preferred.
Motion	GSAP + ScrollTrigger, Lenis smooth scroll, HTML canvas 2D for the hero	Proven scroll-driven tools. Canvas 2D is far lighter than WebGL on mid-range phones.
Backend (Phase 2)	Node.js + Express, PostgreSQL, Prisma	Simple, well supported, easy to host.
Admin (Phase 3)	Separate protected section of the same React app	One codebase, shared components.

If Abdullah prefers a different stack (for example the one used on other projects), say so now. Changing it later is expensive.

PHASE 1

Frontend

The complete visual experience, running on mock data. No backend yet.

Goal

A finished, polished, fully responsive storefront in the Gallery Noir theme, with an animated hero and scroll-driven reveals. It reads all painting data through a single data layer (a JSON file for now) so that Phase 2 can swap in the real API without touching the UI.

Pages (proposed, confirm)

Page	Contents
Home	Animated hero, featured works revealed on scroll, short studio introduction, link into the shop.
Shop / Gallery	Grid of paintings, filter by availability, sold paintings clearly marked SOLD.
Painting detail	Large image with zoom, title, price, size, medium, year, status, add to cart. Extra images shown as a stacked or grid view, not a slider.
Cart and Checkout	Cart, then checkout form (name, phone, address, notes). UI only in this phase. Payment method selector shown but not wired.
About	The artist and the studio's story.
Contact	Contact details and a contact form (UI only in this phase).

Hero specification

- **Concept: paint in motion.** The screen opens on warm black. Thick gold, bronze, champagne and charcoal strokes sweep in and layer like a palette knife, then settle. The wordmark "THE ATELIER BY SK" fades in over a soft dark scrim, followed by the script tagline "Art lives here". Total intro about 2.5 to 3.5 seconds.
- After the intro the surface stays alive: a slow ambient shimmer on the paint ridges. On desktop a soft light follows the cursor. On phones, touch or a gentle parallax replaces it.
- On scroll the strokes drift and the first paintings emerge from the dark.
- Built with canvas 2D. No WebGL in Phase 1.
- **Performance rules:** pause when the tab is hidden or the hero is off-screen; cap device pixel ratio at 1.5; fewer strokes on low-power devices; target a steady 50 to 60 fps.
- **Accessibility:** honour prefers-reduced-motion by showing the finished composition with no animation. This is a fallback for that setting only, not a static hero.

Painting data model (mock, mirrors the future database)

id, slug, title, description, price (PKR), width and height (cm), medium, year, images[], status (available or sold), featured (true or false). Each painting is a **one-of-one original**: no quantity selector, and a sold painting cannot be added to the cart. Use 10 to 12 clearly marked placeholder paintings until the real photos arrive.

Milestones

#	Scope	Done when
M1.1	Project setup, design tokens, fonts, routing, layout shell (nav and footer), smooth scroll, mock data layer.	Empty pages route correctly. Tokens match this plan exactly. Nav works on mobile and desktop.
M1.2	Animated hero with wordmark, tagline, scroll cue, reduced-motion and low-power fallbacks.	Intro plays smoothly on a mid-range phone. Wordmark is readable at every moment. Reduced-motion shows the finished frame.
M1.3	Home page: scroll-driven transition out of the hero, featured works reveal, studio introduction.	No carousel anywhere. Reveals feel smooth, nothing jumps. Layout holds from 360 px to 1920 px wide.
M1.4	Shop grid and painting detail page, with filters, image zoom and sold state.	Sold works cannot be added to the cart. Zoom is sharp on desktop and works by tap on phones.
M1.5	Cart, checkout form UI, About and Contact pages.	Cart persists on refresh. Form validation works. Payment selector is visibly marked as not yet active.
M1.6	Polish and QA: performance, accessibility, cross-browser, responsive sweep.	LCP under 2.5 s on mobile, CLS under 0.1, text contrast passes, keyboard navigation works, no console errors.

Not in Phase 1: real data, accounts and login, payments, emails, admin screens, blog, search, wishlists, multi-language.

PHASE 2

Backend

Real data, real orders. The frontend stops using mock data.

Goal

A secure API and database that serve paintings, take orders, and prevent the same one-of-one painting from being sold twice. Payments arrive in two steps so the studio can launch without waiting on a merchant account.

Data model

- **Painting** and **PaintingImage** (ordered images).
- **Order** and **OrderItem**: guest checkout (customer name, phone, email, address inline), status, payment method, payment status, totals.
- **AdminUser**: email and hashed password.

Core rules

- **No double-selling**. Placing an order reserves each painting atomically. A reserved painting cannot be ordered by someone else. Cancelled or expired orders release it.
- Prices are always calculated on the server. The browser is never trusted for totals.
- Admin routes require authentication. Passwords hashed, tokens in httpOnly cookies, rate limiting on login, input validation on every endpoint, image uploads checked for type and size, secrets only in environment variables.

Payments (tentative)

Step	What	Notes
2A	Cash on delivery and bank transfer. Orders are confirmed manually in the admin panel.	Ships first. No third party needed.
2B	Online payment gateway, built behind a payment adapter so it can be plugged in without changing the order flow.	Which gateway depends on what the client can actually get approved for as a merchant in Pakistan. Verify onboarding requirements and timelines with the client before building. Merchant approval can take weeks, so start that paperwork early.

Milestones

#	Scope	Done when
M2.1	Database schema, migrations, seed data, server setup, environment config.	Server runs locally. Seed creates the placeholder paintings.
M2.2	Public API: list paintings, painting by slug, with images.	Frontend reads from the API instead of the JSON file. No visual change.
M2.3	Orders: create order, atomic reservation, order confirmation to the customer and to the studio by email.	Two simultaneous orders for one painting: exactly one succeeds. Emails arrive.
M2.4	Admin authentication and protected routes.	Unauthenticated requests are rejected. Login is rate limited.
M2.5 (2A)	COD and bank transfer flow, order status workflow.	Customer can complete checkout end to end. Status changes are recorded.
M2.6 (2B)	Payment gateway via the adapter, webhook handling, failed and abandoned payment cases.	Only built once the gateway is chosen and the merchant account exists. Test mode passes every case.

Not in Phase 2: customer accounts, wishlists, discount codes, shipping-rate engines, multi-currency, invoices.

PHASE 3

Admin Panel

Everything the studio needs to run the store without a developer.

Goal

A simple, protected, mobile-friendly panel where the owner can add and edit paintings and handle orders. Styled in the same Gallery Noir theme, but plainer and optimised for clarity over spectacle.

Features

Area	Includes
Paintings	Add, edit, delete. Fields: title, description, price, size, medium, year, status, featured. Upload multiple images, reorder them, choose the main one.
Orders	List with filters, order detail, status updates (pending, confirmed, shipped, delivered, cancelled), mark as paid for COD and bank transfer.
Dashboard	Simple counts only: paintings available and sold, orders waiting for action.
Account	Login, logout, change password.

Milestones

#	Scope	Done when
M3.1	Admin shell, login screen, protected routing, navigation.	Cannot reach any admin page without logging in.
M3.2	Paintings management with image upload and reordering.	A new painting added in admin appears on the live shop immediately.
M3.3	Orders management and status workflow.	Status changes show correctly and trigger the planned notifications.
M3.4	Dashboard counts, account settings, final QA.	Works well on a phone. Owner can complete every task unaided.

Not in Phase 3: analytics, multi-user roles and permissions, discount codes, blog or CMS, reporting exports. Add only if the client asks and the scope is agreed first.

4. What we need before and during the build

Item	Needed for	Owner
High-resolution photos of the real paintings, with titles, sizes, mediums	Phase 1, from M1.3 onward	Abdullah, from the client
The artist's story and bio text, plus contact details (email, phone, WhatsApp, Instagram)	M1.5	Abdullah, from the client
Are the paintings originals only, or will prints be sold too?	Data model, before M1.4	Abdullah, ask the client
Shipping: which cities, flat rate or free, who delivers	Phase 2 checkout	Abdullah, ask the client
Domain name and hosting decision	Before launch	Abdullah and the client
Payment gateway choice and merchant account application	Start early, needed for M2.6	The client, with Abdullah's help
Stack confirmation (section 3)	Before M1.1	Abdullah
